Project Nexus: Technical Specifications

1. Project Overview

Project Nexus is a next-generation quantum routing protocol designed specifically for deep-sea data transmission. The project was officially initiated on October 14th, 2024.

2. Core Components

- The primary hyper-threading matrix is coded in a proprietary language called 'Abyss-Lang'.
- The system operates at a maximum temperature threshold of 4.2 Kelvin. If this threshold is breached, the 'Aegis Protocol' automatically shuts down the mainframe.

3. Key Personnel

- Lead Architect: Dr. Aris Thorne.
- Security Director: Commander Elena Rostova.

4. Security Protocols

To access the Level 3 diagnostic terminal, engineers must use the override code: 'NEXUS-99-OMEGA'.
